DefenseReview (DR) has been following Chinese and Russian military technology capabilities and advancements for quite some time now, so we weren't surprised to read about the Chinese PLA's (People's Liberation Army) drive to dominate the United States of America militarily and to win World War III (WWIII), should it happen, and their pursuit of every single advanced military warfare technology to do it. According to Breitbart News, Center for Strategic and International Studies (CSIS) is really sounding the alarm on this one. "China sees offensive cyber capabilities, anti-satellite weapons, electronic warfare tools, hypersonic weapons, artificial intelligence [AI], and quantum [computing] technologies as key to enabling the PLA [People's Liberation Army] to win wars in future, high-tech conditions and offset the advantages of the U.S. military, and has made significant strides in all of these areas," says CSIS deputy director William Carter. He also warned that "We may have more and better aircraft carriers, tanks, and missiles than the PLA, but without access to data and connectivity many of these systems are ineffective or even inoperable," and that China considers US military satellites to be our "Achilles heel".

DR finds the idea of China's potential surpassing of US military quantum-computing focus and advancement to be particularly alarming, since quantum computing and AI can be used to enhance the capabilities of EVERY other military technology and system. It's absolutely crucial that the US military stay ahead of the Chinese and Russian militaries' on these combined technological fronts, if we want to be able to effectively and successfully fight either country individually, or a combined Sino-Russian military force in a WWIII-level scenario, or in smaller, limited conflicts.

As Defense Review's written before, our focus should be on being able to defeat a combined Sino-Russian military threat, not just being able to defeat them individually. We must ASSUME and EXPECT that they'll team up against us in a future nation-state war, and act and prepare accordingly, militarily and economically. This is our opinion, and we think we're right about this.

Of course, as we've also written, we have to do this without creating a Skynet-type AI robotic Armageddon scenario, a la *Terminator*. It's gonna' be a tough balance.
